

Mark System Instructions

Provision the safety boat (marks, inflator/deflator, anchors and anchor line reel)

Take one section of anchor line and lash it to the anchor line reel ...

... and attach it to the boat

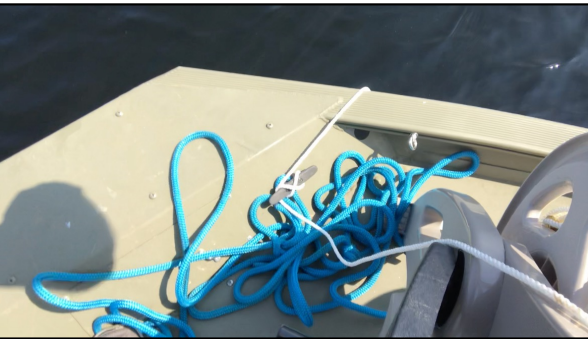

On the way out to the course, fill the marks with the inflator (30-40 seconds for small, 2 ½ minutes for large marks)

The cylinders have an air lock that is closed by pushing in on the center post, turning to the left and releasing

Attach the anchor and throw overboard, let the anchor reel unwind by itself until it stops

Clear the anchor line so that boat does not drift away from the mark ... use an additional 10' section of anchor line if needed

Detach the section connected to the anchor while keeping the section that is connected to the reel attached temporarily and then connect the anchor line to the bale closest to the tip of the tetrahedron

Break the connection with the anchor reel, unclear the anchor line and send the mark overboard

Use the boat hook to bring the marks on board

Haul the anchor up ... careful not to drag the anchor fastener across the gunnel (it can catch and drop the anchor)

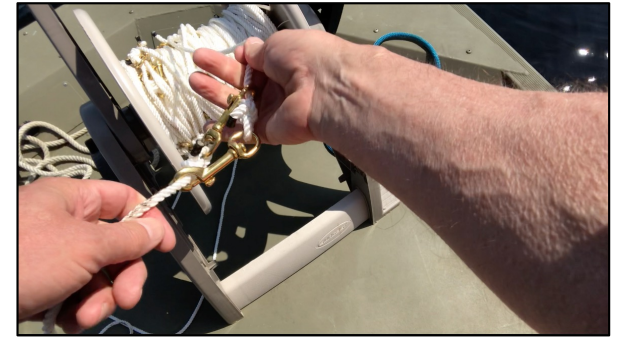

Method 1: let the anchor line gather where, then toss the gathered anchor line overboard to sort itself out

Method 2: continuously feed the gathered anchor line back into the lake

Disconnect anchor line from the mark (the other end is still attached to the anchor)

Connect the end that was connected to the mark and connect it to the anchor line reel

Disconnect the anchor line from the anchor and throw the loose end of the anchor line overboard and the reel in the anchor line

When done with the anchor line, loop it through one of the ends of the spool and clasp the line upon itself

Use the deflator to deflate the marks on the way back to shore
